

Climate Health Intelligence System (CHIS) Privacy Policy

Generated for download from the CHIS public policy pages.

1. Introduction

The Climate Health Intelligence System (CHIS) supports climate-informed public health monitoring and response. Our privacy mission is to protect access to system information while giving authorized teams the visibility they need to coordinate risk response and operational follow-through.

2. Information We Collect

User information includes names, email addresses, phone numbers, user role, county, and organization details used for account access and operations.

System data includes security events, login activity, and interaction metadata used to maintain system integrity and investigate misuse.

Environmental and health data includes climate, rainfall, risk, and operational records used to support planning, monitoring, and coordinated response.

CHIS does not collect, store, or process individual patient health records as part of routine system use.

3. How We Use Data

We use system data to generate and distribute climate-health risk insights to authorized users, coordinate monitoring and alerts, support operational decisions, and secure the platform against unauthorized access.

4. Data Sharing

We share system information only with authorized operational stakeholders and approved partners when needed to support public health monitoring, response coordination, and system administration. Access remains role-based and limited to work-related needs.

5. Data Security

We apply strong authentication, audit logging, role-based access control, and other protective controls appropriate for a climate-health operations platform.

6. Data Retention

System information is retained only as long as required for operations, accountability, and reporting needs, and is reviewed periodically against administrative requirements.

7. User Responsibilities

Authorized users are responsible for protecting their credentials, respecting role boundaries, and reporting any suspected misuse or unauthorized access immediately.
